Q. Call the summary() function on your results to get a sense of how many genes are up or down-regulated at the default 0.1 p-value cutoff.

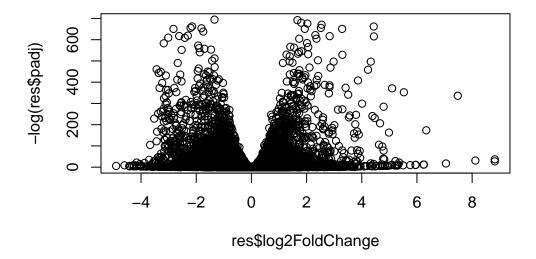

At the 0.1 p-value cutoff, there are 4349 upregulated genes and 4396 downregulated genes.

```

Q. Improve this plot by completing the below code, which adds color and axis labels

Adding gene annotation

Q. Use the mapIDs() function multiple times to add SYMBOL, ENTREZID and GENENAME annotation to our results by completing the code below.

```

Section 4. Reactome Analysis

```
sig_genes <- res[res$padj <= 0.05 & !is.na(res$padj), "symbol"]
print(paste("Total number of significant genes:", length(sig_genes)))</pre>
```

[1] "Total number of significant genes: 8147"

Q: What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

The cell cycle pathway has the most significant "Entities p-value" with a p-value of 1.09E-4. This does not quite match the previous KEGG results. A lot of the genes were "not found" during the reactome analysis which could influe this. Another cause of the difference between the KEGG pathway analysis and the reactome analysis is that there are different amounts of underlying data between the 2 databases.
